

What to Expect in V2

Verato v1 proved the core idea: AI reads your meeting transcripts, extracts every commitment, and nudges owners before things slip. V2 makes Verato the operating system a Chief of Staff actually lives in every day.

Here is what is coming.

1. Your Meetings Come to Verato — You Do Nothing

Right now you have to download a transcript and upload it manually. In V2, that step disappears entirely.

Connect your Google Calendar once. From that point on, the moment a Google Meet call ends, Verato automatically pulls the transcript, processes it, and surfaces the commitments — no clicks, no file management. If your team uses Zoom, a webhook integration does the same thing the second the recording is ready.

The goal: a CoS who attends 15 meetings on Monday has all 15 processed and reviewed by Tuesday morning without having touched Verato once.

2. The Dashboard Answers "How Is the Product Launch Looking?"

Today the dashboard shows a list of individual commitments sorted by status. That is useful for a checklist, but a CoS needs to answer strategic questions — fast.

V2 introduces **Strategic Pillars**. You define your key initiatives (Q3 Product Launch, Board Prep, Hiring Plan, etc.) and Verato groups all commitments underneath them. At the top of each pillar, an AI-generated executive summary gives you the answer in three sentences:

"The Product Launch is trending Amber. Engineering is meeting 90% of commitments, but Marketing has missed 3 deadlines this week, putting the Friday timeline at risk."

Green, Amber, or Red status is computed automatically from the underlying commitments. You get a board-ready summary without opening a spreadsheet.

3. Verato Tells You Why Something Is Slipping — Not Just That It Is

A date change is not the same as a blockade. V2 can tell the difference.

When an owner replies to a nudge saying "I'm still waiting on John's team to hand over the API keys," Verato doesn't just log a new deadline. It flags this as a **Cross-Functional Blockade** — highlights it on the dashboard, names the blocking team, and puts it in front of the CoS as something that requires their intervention, not just a follow-up email.

This is the difference between tracking commitments and managing the politics around them.

4. See Your Organisation by Department, Not Just by Person

V1 shows delivery rates per individual. V2 aggregates this into a **Department Health Heatmap** — a visual grid that shows which teams are consistently hitting deadlines and which are bottlenecked, across the last 2 weeks, last month, and last quarter.

It also tracks **Commitment Debt**. If a VP consistently extends every deadline by 2 days, week after week, Verato flags them as a chronic under-estimator. This gives the CoS the context to adjust timelines in planning, rather than being surprised at review.

5. Nudge Replies Become CoS Decisions, Not Dead Ends

V1 handles simple replies: "done" marks it complete, "next week" extends the deadline. A long paragraph explaining a complex situation currently gets ignored or fails to parse.

In V2, any reply that can't be cleanly resolved lands in a **CoS Review Queue**. Verato presents:

- The full reply from the owner
- A plain-English Gemini summary: *"Sarah says the slides are blocked on updated financial figures from Finance. She is requesting a 3-day extension."*
- The history of this commitment — prior nudges, prior extensions
- Two buttons: **Approve Extension** or **Send Escalation Nudge**

Nothing falls through the cracks. Every reply either resolves automatically or gets a decision from the CoS.

The Bigger Picture

V1 gave you a commitment tracker. V2 gives you a CoS command centre.

By the end of V2, Verato should feel like a Chief of Staff's second brain — one that attends every meeting silently, remembers every promise, reads between the lines of every reply, and puts only the decisions that genuinely need human judgement in front of you.
